Virus Shield Information Virus Shield is a commercial application that monitors the behavior of files and the network access made by your computer. So it can detect any suspicious activity and block the access to known threat. When the file or the network activity appears, the application opens a dialog box where you can select which files and/or activities to quarantine and which ones to allow. Also, it is possible to set passwords to recognize the files and activities. This allows you to restrict the access to only the safe files and activities. The application is compatible with the most virus scanner applications on the market. However, it should not replace the virus scanner itself. Virus Shield is designed to complement any antivirus application and it is not designed to replace it.

The program contains an embedded backup script. If the embedded backup script is used, then the following will happen: 1. The current user's session is terminated by the shutdown command of the backup script. 2. Your backup file is placed in the specified backup folder (default location is %TMP%\PartitionSaving). 3. You will receive a letter in your desktop folder with a filename of your choosing, which will be saved automatically. Notes: 1. Depending on your backup devices, the user interface will be in English by default. 2. If you are running Windows XP, then you need to enable BitLocker Drive Encryption for successful backup and recovery operations. 3. The Hotkey shortcut of the application (default: Ctrl+Shift+B) cannot be changed. 4. The backup script does not support multiple backup disks at the same time. 5. If you wish to restore a backup from a drive, then you will need to change the backup folder name to the proper drive name, to the backup script will search the backup on the designated drive. 6. If you wish to make a single backup for multiple drives (e.g. Backup a drive A and a drive B), then you should use both drive letters (e.g. A,B) in the backup folder name. 7. By default, the backup file is stored without a password. 8. If you wish to restore a backup to an external drive, with the password required, you can add the PWD variable in the backup script, with the password. 9. Please make sure that the backup disk or partition is not being used by any other application at the time of the backup. 10. The backup script uses the Secure Erase command to do a secure disk erase. Thus, the backup file will be reset and you will lose the ability to restore it on other drives as well. 11. If you wish to protect all the backup files of your computer, you can select the Secure Erase option. It will delete all the backup files (except for a backup file) and you will be asked to enter a password. 12. To check all the backup files that you have created, you can open the backup folder using Windows Explorer or the Taskbar from the option, "View Options" or type the following command from the command line (run as an administrator): "cd "\Program Files\PartitionSaving\Backups"" 13.

What's New in the Partition Saving?

Description of Partition Saving Partition Saving is an application that helps you to backup all the information contained in the hard disk partitions, such as the boot information, windows partitions, the master boot record sector and personal information. The backup process can be done using a single file or several files. Partition Saving offers two types of functions: Backup the whole partition: This function will help you create a partition image file that can be read by a similar system in case the partition is lost. The final product is a partition image file named as the exact name of the partition file that was used to create it. Backup the data: This function helps you save individual files in the partition or a file in a location of your choice. Other than that, the application has some advanced features: You can choose whether to copy files in the same directory or in another location, depending on your preferences. You can add or remove files from the backup list, based on your preferences. This application doesn't include disk images, but it can generate a number of disk image-like files. Furthermore, the generated files can be copied and compressed. This application supports different file types that include .ibf files (used to store disk images), .pbf (used to compress disk images), .bhf, .shf, .mbcf, .mbcf (used to create bootstrap files) and .sh (used to compress partitioned disk images). There is a file explorer that can view the image files. This application creates backup files with the .ibf extension. In Windows, the backup files can be accessed by showing the image files on the desktop. Partition Saving comes with a set of tools to manipulate individual partitions on your hard disk. These tools can be used to fix damaged sectors, replace the FAT or NTFS boot sectors, fix broken FAT or NTFS boot sectors, update the partition entries in the Windows registry, and fix bad sectors in the NTFS partition. Partition Saving - Backup File Manager The main window of the application comprises a list of hard disk partitions that are backed up by the application. The list is categorized based on the drive letter in which the partition is stored. The list

also comprises hard disk partitions that you cannot access and haven't backed up yet. You can view the list using your keyboard or the mouse. You can use your keyboard to scroll through
